## Lab A <br> Descriptive Statistics

$\mathcal{A}$ large group of grade school teachers throughout the US are asked to provide information regarding the television vie wing habits of their students. Each of you have been assigned data from a 12-student classroom.
$\mathcal{N}$ ote: $\mathcal{N}=10$ in this example ; Your lab fas $\mathcal{N}=12$

25252418261940705026

For questions 1.6 treat your data as a population.

1. What is the mean? $(25+25+24+18+26+19+40+70+50+26) / 10=32.30$
2. What is the sum of $x$ ? $(25+25+24+18+26+19+40+70+50+26)=323$
3. What is the sum of $x$-squared? $\left(25^{2}+25^{2}+24^{2}+18^{2}+26^{2}+19^{2}+40^{2}+70^{2}+50^{2}+26^{2}\right)=12863$
4. What is the population variance? $\left[\left(12863-323^{2} / 10\right)\right] / 10=243.01$
5. What score reflects the 90 th percentile? ( $\mathcal{N}$ ote: Your lab as 97\%)

$$
+1.28(\sqrt{243.01})+32.3=52.25
$$

6. What percentage of scores fall between the me an and a score of 30 ?

First find the $z$-score: $z=(30-32.30) / \sqrt{243.01}=-.1475$
$z=-.1475$ corresponds to .0596 of the curve between the me an and $z$.

For question 7-9 treat your data as a sample.
7. Find the $95 \%$ confidence interval around the mean.

For the confidence interval, you need $s$,

$$
\text { so }\left\{\left[\left(12863-323^{2}\right) / 10\right] / 9\right\}^{.5}=16.43
$$

$32.30 \pm(16.43 / \sqrt{10}) 2.262 \quad 20.55 \leq \mu \leq 44.05$
8. Discuss what this interval means.

## Lab B <br> Chi-square

Problem a:

Law schoolstudents and other students at a university are asked to complete a survey. The researcher knows the proportion of lawstudents at the university I $p$ (Lawyers) ]. She wonders if the number of [awyers who complete the survey [ Obs(Lawyers)] versus other students [ $\mathcal{N}$ O6s(Lawyers) is what one would expect given this $\mathcal{N}$ and proportion of lawstudents. Ulse the chisquare goodness of fit test to assess whether observations are consistent or inconsistent with expectations. In your response to the questions, use the information for Problem a in the data set number assigned to you by the teaching assistant.

$$
\begin{aligned}
p(\text { Lawyers })=.35 \quad & \text { O6s }(\text { Lawyers })=27 \quad \mathcal{N}=60 \\
& \text { Exp }(\text { Lawyers })=.35(60)=21 \\
& \text { O6s (otherstudents) }=60-27=33 \\
& \text { Exp(otferstudents })=60-21 \text { or }(1-.35)(60)=39
\end{aligned}
$$

$\sum(O-\mathcal{E})^{2} / \mathcal{E} \quad(27-21)^{2} / 21+(33.39)^{2} / 39=2.637$ ns for $1 d f$

Problem 6:

Another researcher sends out surveys to students in the engine ering school and the law school. She counts the number of survey-completers fromeach school who are male versus female, and wonders whether gender and school are related. In your response to the questions, use the information for Problem 6 in the data set number assigned to youby the teaching assistant.

| O6s (Fem-Law) | O6s (Mal-Law) |
| :---: | :---: |
| 20 | 9 |
| Obs(Fem-Eng) | Obs (Fem-Eng) |
| 16 | 14 |

| Expected Value for $=\left(36^{*} 29\right) / 59$ | $=$ | 17.69 |
| :--- | :--- | :--- |
| Expected Value for $=\left(30^{*} 36\right) / 59$ | $=$ | 18.31 |
| Expected Value for $=\left(29^{*} 23\right) / 59$ | $=$ | 11.31 |
| Expected Value for $=\left(23^{*} 30\right) / 59$ | $=$ | 11.69 |

$\frac{(20-17.69)^{2}}{17.69}+\frac{(16-18.31)^{2}}{18.31}+\frac{(9-11.31)^{2}}{11.31}+\frac{(14-11.69)^{2}}{11.69}$ $=1.52 \mathrm{~ns}$ for 1 df

## Lab C

## One-way Between Groups ANOVA

One-way between groups $\mathcal{A N} \mathcal{V} \mathcal{A}$ also can be computed with the heuristic formula:
$\sum S^{2}=210+185.7+202.27+139.9+346.27=1084.14$
$S_{x}^{2}=\frac{\sum x^{2} \cdot\left(\sum x\right)^{2} / n_{x}}{n_{x}-1}$
$\underline{22^{2}+21.33^{2}+21.083^{2}+18.08^{2}+39.5^{2}-(22+21.33+21.083+18.08+39.5)^{2} / 5}$
5-1
$=73.50$
$\mathcal{F}=\frac{n S_{x}^{2}}{\underline{\sum S^{2}} / \mathcal{g}} \quad \frac{12(73.50)}{1084.14 / 5} \quad=\frac{882}{216.83} \quad=4.07$

## Lab D <br> Tests Subsequent to ANOVA

predicted $y=27.26+.0838 x$

Create a bivariate plot of the data, and drawthe regression line from \# 6.

## Lab I

## Standard Multiple Regression

A researcher was interested in predicting aggressive behavior among ten male adolescents from their dispositional aggressiveness as well as the number of hours they viewed television violence each week. The researcher wished to assess the unique contribution of disposition and of television, as well as assessing how well the two factors predicted aggressive behavior. In answering the following questions, use the data set assigned to you by the teaching assistant.

Note that you have been provided with summary information this time, rather than the raw data. Specifically, you need the first line of information, which is labeled StandardMR

| DataSet 175 | b1 | b2 | a | sb1 | sb2 | R |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | ---: |
| StandardMR | 0.50672808 | 0.68606933 | 8.80198433 | 0.65743614 | 0.66400936 | 0.50 |  |
| HierarchMR | Step 1b1 | Step1a | Step1R | Step1sb1 |  |  |  |
|  |  | 0.71000788 | 9.97084318 | 0.37015366 | 0.62999641 |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
| DataSet | 175 | tb1 | tb2 |  | F-R12y |  |  |
|  |  | 0.77076395 | 1.03322238 |  |  |  |  |
|  |  | Step1tb1 |  | F-Step1 | F-Step2 | F-change |  |
|  |  | 1.12700305 |  | 1.27013588 | 1.17409928 | 1.06736701 |  |

1. In tabular format, report the coefficients, standard errors of the bs, t-tests on the bs, and significance of the bs.

| Coefficients | std error | significance |  |
| ---: | :---: | :---: | :--- |
| 8.802 | .657 | $.507 / .657$ | $=.772$ |

2. Test the significance of multiple R (R12y)

$$
\begin{aligned}
& \mathrm{F}_{(2,7)}=\left[.5012^{2} / 2\right] /\left[1-.5012^{2}\right] /[10-2-1]=.1256 / .107=1.174 \\
& \mathrm{~F}_{(2,7)}=1.174, \mathrm{~ns}
\end{aligned}
$$

3. Interpret the findings of the analysis.

## Lab J

Hierarchical Multiple Regression
A researcher believes that viewing television violence predicts aggressive behavior among ten adolescent males, above and beyond their dispositional aggressiveness. He enters dispositional aggressiveness on step one, then adds violent television viewing on step two. In answering the following questions, use the data set assigned to you by the teaching assistant.

Note that you again have been provided with summary information, rather than the raw data. Note also that your summary information is the same as for Lab H, so you already should have accomplished some of the calculations. The first line of information, labeled StandardMR, provides the information relevant to the second step. The second line of information, labeled HierarchMR, provides information relevant to the first step and to the hierarchical test.

| DataSet 175 | b1 | b2 | a | sb1 | sb2 R12y |
| :---: | :---: | :---: | :---: | :---: | :---: |
| StandardMR | 0.50672808 | 0.68606933 | 8.80198433 | 0.65743614 | 0.664009360 .50119121 |
| HierarchMR | Step 1b1 | Step1a | Step1R | Step1sb1 |  |
|  | 0.71000788 | 9.97084318 | 0.37015366 | 0.62999641 |  |
| DataSet 175 | tb1 | tb2 |  | F-R12y |  |
|  | 0.77076395 | 1.03322238 |  | 1.17409928 |  |
|  | Step1tb1 |  | F-Step1 | F-Step2 | F-change |
|  | 1.12700305 |  | 1.27013588 | 1.17409928 | 1.06736701 |

1. In tabular format, report the coefficients, standard errors of the bs, t-tests on the bs, and significance of the bs for each step.

| Step | One Coefficients | std error | $t$ sis | significance |
| :---: | :---: | :---: | :---: | :---: |
| 9.971 |  |  |  |  |
|  | . 710 | . 63 | . $71 / .63=1.127$ | ns |
| Step Two |  |  |  |  |
|  | Coefficients | std error | $t$ sis | significance |
| 8.802 |  |  |  |  |
|  | . 507 | . 657 | . $507 / .657=.772$ | ns |
|  | . 686 | . 664 | .686/.664 = 1.033 | 3 ns |

2. Test the significance of multiple $R$ at step one (R1y) and step two (R12y)

Step One

$$
\begin{aligned}
& \mathrm{F}_{(1,8)}=\left[.3702^{2} / 1\right] /\left[1-.3702^{2}\right] /[10-1-1]=.3702^{2} / .108=1.269 \\
& \mathrm{~F}_{(1,8)}=1.269, \mathrm{~ns}
\end{aligned}
$$

Step Two

$$
\begin{aligned}
& \mathrm{F}_{(2,7)}=\left[.5012^{2} / 2\right] /\left[1-.5012^{2}\right] /[10-2-1]=.1256 / .107=1.174 \\
& \mathrm{~F}_{(2,7)}=1.174, \mathrm{~ns}
\end{aligned}
$$

3. Test the change in $\mathrm{R}^{2}$

$$
\begin{aligned}
& \mathrm{F} \Delta \mathrm{R}^{2}=\left\{\left[.5012^{2}-.3702^{2}\right] / 1\right\} /\left\{\left[1-.5012^{2}\right] /[10-2-1]\right\}=.11415 / .107=1.067 \\
& \mathrm{~F}_{(1,7} \Delta \mathrm{R}^{2}=1.067, \mathrm{~ns}
\end{aligned}
$$

4. Interpret the findings of the analysis.
