A. B. Freeman School of Business

Course and Faculty Listings

INFORMATION SYSTEMS/PROCESS MANAGEMENT

Professor
Amiya Chakravarty, PhD, London School of Economics, 1976.

Associate Professors
Geoffrey Parker, PhD, Massachusetts Institute of Technology, 1998.

Assistant Professors
Gove Allen, PhD, University of Minnesota, 2001.
Huseyin Cavusoglu, PhD, University of Texas at Dallas, 2003.

Clinical Professor
Priscilla Hagebusch, MBA, Tulane University, 1989.

Instructor
Robin Desman, MBA, Tulane University, 1997.

ISPM 101 Introduction to Business Computing
The goal of Introduction to Business Computing is to ensure that all business students have the computing skills necessary to support subsequent courses in their college career and to prepare students for internships in the business world. The focus of the course will be learning to use Microsoft Office application programs and to pass the Microsoft Office Certification test at the User Level for Microsoft Word and PowerPoint and at the Expert Level for Microsoft Excel. These certification tests are given as part of the coursework. Students who arrive on campus with these certifications already in place may waive this course requirement.

ISPM 301 Business Modeling
Prerequisite: MATH 114.
The purpose of this course is to provide students with the computer modeling skills that the job market expects and to bring all students up to the skill levels that are needed in elective classes so that professors can assume a common starting point. To accomplish these goals, the course focuses on primarily two areas: (1) advanced skill sets in programming and database applications; (2) modeling to solve domain-specific problems using Excel, Visual Basic for Applications (VBA) and Access. Time permitting, a brief (one to two week) introduction to the contemporary issues in information systems such as information economics and information security will be given. The course will cover advanced Excel topics for approximately one-third to two-thirds of the semester with the balance (one or two weeks) being dedicated to Visual Basic and Access.

ISPM 302 Business Process Management
Prerequisites: MATH 114, MATH 115.
Provides an overview of one of the most challenging areas in business – business process management. Process management focuses on the systematic planning, design, and operation of all processes that deliver goods and services. The subject spans almost all of the value-added and supporting activities of an organization, including product and process design, inventory management, project management, and process improvement. This course has two primary objectives: to familiarize students with process management decisions and the environment in which these decisions are made, and to help students master the basic quantitative techniques of process management.

ISPM 410 Project Management
Prerequisites: ISPM 301, MATH 114.
ISPM 410 addresses project management from the perspective of a business manager who faces the planning, initiation, and culmination of large or small projects in a variety of settings. The course presents the basic nature of managing all types of projects (i.e., public, business, and engineering information systems), as well as the critical skills and specific techniques and insights required to carry out successful projects. Topics include characteristics of projects, project selection and organization, work breakdown structure, personnel selection, scheduling, budgeting and resource allocation, conflict and negotiation, project control, evaluation, and termination. The course also introduces and uses industry-standard project management application software.

ISPM 411 Business Programming
Prerequisites: ISPM 301, MATH 114.
ISPM 411 gives the student a background in computer programming logic, concepts, and design through a systematic approach to business problem solving, and the application of
systems-development approach. Although the course uses Visual Basic as the programming platform, a goal of the course is to concentrate on programming concepts independent of the programming language used. The logic and concepts learned in this class are transferable to other programming projects using macro languages in software products, statistical analysis software, and full-scale software development projects.

**ISPM 412 Database Management**
Prerequisites: ISPM 301, MATH 114.
ISPM 412 provides a fundamental overview of the values, concepts, principles, skills, and techniques of modern database management systems and of database business application system development. Topics include the needs of business functions for database systems, components of modern database management systems, components of database application systems, logical/functional planning and design of database applications, modeling new database applications, structures of relational database application systems, and fundamentals of using a typical modern dbms (Oracle, Microsoft Access) to build database application systems. Students will first learn the foundations of database and application structures, tools, and techniques. Then, given a case for database and multifunctional business application requirements, students design, construct, and test an integrated database and associated application components.

**ISPM 413 Systems Analysis and Design**
Prerequisites: ISPM 301, MATH 114.
Systems Analysis and Design (SAD) equips students with the background to understand how to develop information systems more effectively and efficiently. This course presents a core set of skills that every analyst needs to know to excel in this dynamic field. It follows the recent trend in SAD and incorporates object-oriented concepts and techniques within System Development Life Cycle (SDLC). The objective of this course is to provide students with an in-depth knowledge of object-oriented systems analysis and design procedures. The emphasis is on the analysis procedures. At the end of the course, the student will be able to analyze business situations and design computer-based information systems using structured design methodologies.

**ISPM 414 Communications and Networking**
Prerequisites: ISPM 301, MATH 114.
ISPM 414 provides a basic understanding of computer networks and networking protocols from a variety of perspectives. It covers a wide breadth of material, some of it in depth and some of it in overview format. Major topics will include 1) data communications concepts and techniques in a layered architecture, 2) communications switching and routing, 3) network topologies, 4) network protocols, 5) network configuration and management, 6) client-server applications, and 7) peer-to-peer applications.

**ISPM 455 Internship**
Freeman School majors may elect to do an information systems/process management internship that will appear as a one-credit, 400-level course on their transcripts; however, the credit does not apply towards the 122 minimum hours required for a BSM degree. The purpose of the internship must be to apply (within an ongoing business organization) the intellectual capital obtained from first- through third-year courses of the BSM program. Before registering for this course, the student must present a proposal describing how the proposed internship will meet the stated objectives and how the student will demonstrate that the objectives have been met. This proposal must be approved by the instructor before course registration. The student is responsible for locating the firm and arranging an internship position. This course is normally offered only during the summer and fulfills the “curricular practical training” option for students with F-1 visa status.

**ISPM 457 Service Learning Internship**
Freeman School majors may elect to do an information systems/process management service-learning internship that meets the Newcomb-Tulane College public service requirement for graduation; however, the credit does not apply towards major requirements for a BSM degree. Interested students should consult with their academic advisers.

**ISPM 460 Information Security and Risk Management**
Prerequisites: ISPM 301, MATH 114.
Data and information are among an organization’s most valuable assets. Preserving them through effective information risk management is, therefore, an essential task along with other risk management areas such as currency hedging. This course will provide students with a comprehensive understanding of the concepts that underlie effective information security management including confidentiality, integrity, availability, vulnerabilities, threats, risks, and countermeasures. Historical approaches to security and risk management have become increasingly
Information Systems/Process Management

Inadequate. Consequently, the evolution of methodologies focusing on software risk management at the enterprise level is receiving increasing attention, and the need for comprehensive risk management programs has become a necessity. In addition to the legislation and regulations that impact information security, standards and frameworks, both technical and economic, that facilitate efficient information security, will be taught.

**ISPM 461 E-Business Design and Implementation**
Prerequisite: ISPM 412; Corequisite: ISPM 411.
This course provides the fundamental skills to develop websites in order to conduct business on-line. E-business is characterized by the merging of Internet and database technologies. As such, this course focuses on skills needed to build environments (such as electronic storefronts) that allow consumers or organizations to conduct business (such as placing orders) at a website that is integrated with other business processing systems by means of a database management system. This course utilizes and builds upon skills that students have developed in the required core courses as well as the required prerequisite and corequisite elective courses.
