

## MINERALS

### PHYSICAL PROPERTIES OF MINERALS

The Study of rocks allows geologist to understand the history of the Earth. Most Rocks are aggregates of minerals. One must therefore, be able to identify minerals, which are components of common rocks.

**MINERAL.** Naturally occurring inorganic crystalline solid with definite (although not fixed) chemical composition.

#### MINERAL CHEMISTRY.

Earth scientists have identified over 2000 minerals. Minerals are classified based on their chemical composition in groups		
Group	Examples	Comments
<b>Native Elements</b>	Gold [Au], silver [Ag], copper [Cu], sulfur [S], diamond[C], and graphite[C]	
<b>Sulfides</b>	Cinnabar [HgS], pyrite [FeS <sub>2</sub> ], galena [PbS]	
<b>Oxides</b>	Corundum [Al <sub>2</sub> O <sub>3</sub> ], cuprite [Cu <sub>2</sub> O], hematite [Fe <sub>2</sub> O <sub>3</sub> ]	
<b>Halides</b>	Halite [NaCl], sylvite [KCl].	
<b>Carbonates</b>	Calcite [CaCO <sub>3</sub> ], dolomite [CaMg(CO <sub>3</sub> ) <sub>2</sub> ], malachite [Cu <sub>2</sub> CO <sub>3</sub> (OH) <sub>2</sub> ]	Most geologists considered <b>nitrate</b> s and <b>borate</b> s as subcategories of the carbonates.
<b>Sulfates</b>	Anhydrite [CaSO <sub>4</sub> ] gypsum [CaSO <sub>4</sub> · 2H <sub>2</sub> O]	Less common sulfates exist containing substitutions for the sulfate compound for example, in <b>chromate</b> s.
<b>Phosphates</b>	Apatite [Ca <sub>5</sub> (PO <sub>4</sub> ) <sub>3</sub> (F,Cl,OH)]	Phosphates are often classified together with <b>arsenate</b> s, <b>vanadate</b> s, <b>tungstate</b> s, and <b>molybdate</b> s.
<b>Silicates</b>	albite [NaAlSi <sub>3</sub> O <sub>8</sub> ], augite [Ca,Na)(Mg,Fe,Al)(Si,Al) <sub>2</sub> O <sub>6</sub> ], beryl [Be <sub>3</sub> Al <sub>2</sub> (Si <sub>6</sub> O <sub>18</sub> ), biotite [K(Mg,Fe) <sub>3</sub> (AlSi <sub>3</sub> O <sub>10</sub> (OH) <sub>2</sub> ], hornblende [(Ca,Na) <sub>2-3</sub> (Mg,Fe,Al)Si <sub>6</sub> (Si,Al) <sub>2</sub> O <sub>22</sub> (OH) <sub>2</sub> ], microcline [KAlSi <sub>3</sub> O <sub>8</sub> ], muscovite [KAl <sub>2</sub> (AlSi <sub>3</sub> O <sub>10</sub> (OH) <sub>2</sub> ], olivine [Mg, Fe) <sub>2</sub> SiO <sub>4</sub> ], orthoclase [KAlSi <sub>3</sub> O <sub>8</sub> ], and quartz [SiO <sub>2</sub> ]	Largest group of minerals

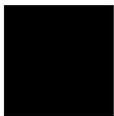

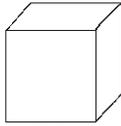

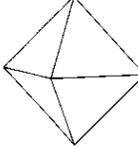

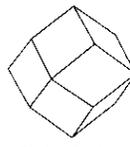

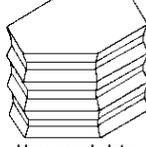

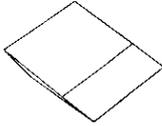

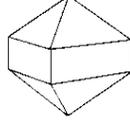

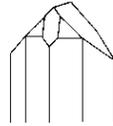

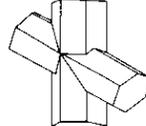

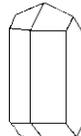

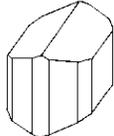

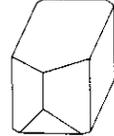

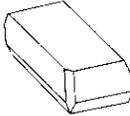

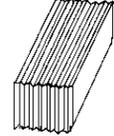

The **IDENTIFICATION OF MINERALS** can be based upon their physical properties. Physical properties diagnostic of minerals include:

- ✓ **CRYSTAL FORM OR STRUCTURE**
- ✓ **FRACTURE AND CLEAVAGE**
- ✓ **TENACITY**
- ✓ **SPECIFIC GRAVITY**
- ✓ **HARDNESS**
- ✓ **PROPERTIES RELATED TO LIGHT**
  - ☺ **COLOR**
  - ☺ **LUSTER**
  - ☺ **STREAK**
  - ☺ **DIAPHANEITY**
- ✓ **SPECIAL PROPERTIES**
  - ☺ **MAGNETISM**
- ✓ **ACID OR CHEMICAL REACTION**
- ✓ **TASTE**
- ✓ **ODOR**
- ✓ **FEEL**
- ✓ **FLUORESCENCE**
- ☐ etc.

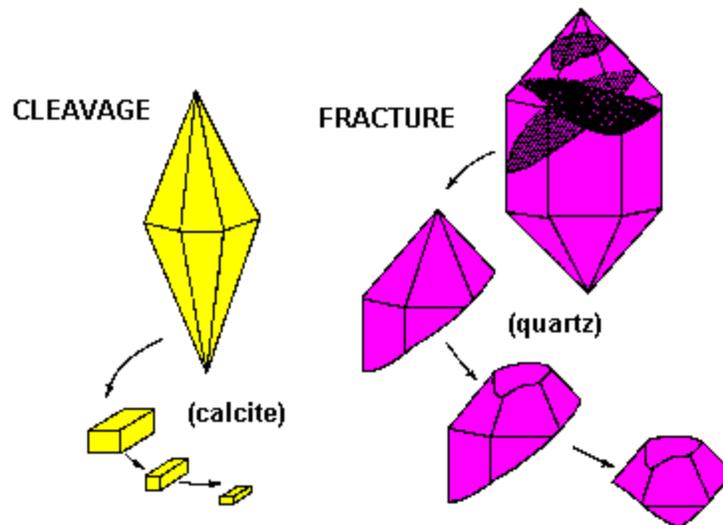

### CRYSTAL FORM OR STRUCTURE

Reflection of the internal atomic structure of the minerals. Crystal faces are planar surfaces that develop if a crystal grows in an unimpeded manner in an uncrowned environment (Minerals rarely show perfect development of crystal faces.

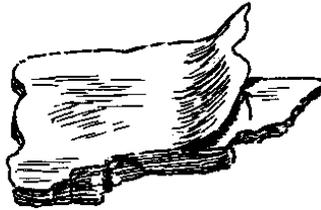

**(You can't tell crystalline from an aggregate)**

CRYSTAL SYSTEM	COMMON FORMS AND EXAMPLES		
<b>Cubic</b> 	 Cube (Halite)	 Octahedron (Fluorite)	 Dodecahedron (Garnet)
<b>Hexagonal</b> 	 Hexagonal prism / pyramid (Quartz)	 Hexagonal plates (Molybdenite)	 Rhombohedron (Calcite)
<b>Tetragonal</b> 	 Tetragonal disphenoid (Chalcopyrite)	 Tetragonal prism (Scheelite)	
<b>Orthorhombic</b> 	 Combined form (Topaz)	 Combined form (Staurolite twin)	 Orthorhombic prism (Sulfur)
<b>Monoclinic</b> 	 Combined form (Gypsum)	 Combined form (Hornblende)	 Combined form (Orthoclase [Potassium Feldspar])
<b>Triclinic</b> 	 Combined form (Rhodonite)	 Twinned plagioclase (Albite)	 Combined form (Plagioclase feldspar)

<b>FRACTURE AND CLEAVAGE</b>	
Description of the way in which a mineral breaks	
<b>Irregular breaks are called FRACTURES</b>	Breaks <b>along planes</b> are called <b>CLEAVAGE PLANES</b> .
<b>FRACTURE</b>	<b>CLEAVAGE DIRECTION</b>
<b>IRREGULAR</b>	<b>1</b> (micas: biotite, muscovite)
<b>FIBROUS</b>	<b>2 @ 90</b> (plagioclase, orthoclase)
<b>CONCHOIDAL</b> (quartz; glass)	<b>2 not @ 90</b> (hornblende)
<b>SPLINTERY</b> (asbestos)	<b>3 @ 90</b> (halite)
	<b>3 not @ 90</b> (calcite)
	<b>4 not @ 90</b> (fluorite)
	<b>6 not @ 90</b> (sphalerite)

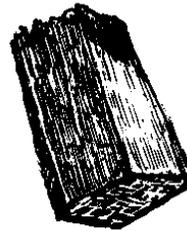

### CLEAVAGE

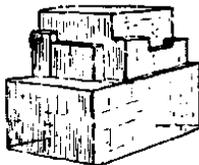

CLEAVAGE IN ONE DIRECTION

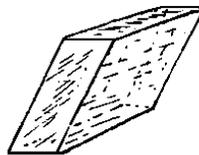

CLEAVAGE IN TWO DIRECTIONS  
@ RIGHT ANGLES

CLEAVAGE IN TWO DIRECTIONS  
NOT @ RIGHT ANGLES

CLEAVAGE IN THREE DIRECTIONS  
@ 90 DEGREES

CLEAVAGE IN THREE DIRECTIONS  
@ 60 DEGREES (NOT @ 90 DEGREES)

CLEAVAGE IN FOUR DIRECTIONS

CLEAVAGE IN SIX DIRECTIONS

<b>TENACITY</b>	
Index of a mineral's resistance to be broken or bent	
<b>BRITTLE</b>	(Shatters; <b>quartz</b> ),
<b>ELASTIC</b>	(Bends, returns to its original shape; <b>biotite</b> ),
<b>FLEXIBLE</b>	(Bends, does not return to original shape; <b>gypsum</b> ),
<b>SECTILE</b>	(Resistant to be cut by a knife; <b>talc</b> ),
<b>MALLEABLE</b>	(Resistant to breakage; pounded into different shapes; <b>gold, copper</b> ).

<b>SPECIFIC GRAVITY</b>	
Measure of the relative weight of a substance. Ratio of between the mass of a minerals and the mass of an equal volume of water. ( <b>HEFT</b> )	
Useful only if the mineral is “heavy”	
Galena (PbS)	7.5
common Silicates	2.7-2.9

<b>HARDNESS</b>			
Ability of a mineral to resist abrasion. Resistance of a mineral to be scratch.			
Relative property			
<b>MOHS SCALE (1812):</b>			
<b>1</b>	<b>TALC</b>		<b>The</b>
<b>2</b>	<b>GYPSUM</b>	Fingernail 2.5	<b>Green</b>
<b>3</b>	<b>CALCITE</b>	Copper Penny 3	<b>Clawed</b>
<b>4</b>	<b>FLUORITE</b>		<b>Ferocious</b>
<b>5</b>	<b>APATITE</b>	Pocket Knife Blade 5	<b>Aardvark</b>
<b>6</b>	<b>ORTHOCLASE</b>	Glass 5.5	<b>Ordered</b>
<b>7</b>	<b>QUARTZ</b>		<b>Quick</b>
<b>8</b>	<b>TOPAZ</b>		<b>Tasty</b>
<b>9</b>	<b>CORUNDUM</b>		<b>Chinese</b>
<b>10</b>	<b>DIAMOND</b>		<b>Dinners</b>
Two minerals with the same hardness will scratch each other			
<b>Greater or less than Glass Plate (LAB KIT)</b>			

### PROPERTIES RELATED TO LIGHT

<b>COLOR</b>	
Usually the first an most easily observed property of a mineral.	
<b>Not diagnostic</b> for most minerals	
<b>Quartz, Fluorite</b>	Purple, black, white, green yellow, pink, almost any color).
For a few is diagnostic	
<b>Azurite</b>	Blue
<b>Malachite</b>	Green
<b>Galena</b>	Gray
<b>Olivine</b>	Green
<b>Sulfur</b>	Yellow

<b>LUSTER</b>	
Way in which the surface of minerals reflect light (in a fresh surface).	
<b>METALLIC</b>	Galena, pyrite
<b>NON METALLIC</b>	
<b>VITREOUS OR GLASSY</b>	Quartz
<b>PEARLY</b>	Talc
<b>SILKY</b>	Gypsum
<b>RESINOUS</b>	Sphalerite, sulfur
<b>EARTHY OR DULL</b>	Kaolinite, limonite
<b>GREASY OR OILY, ADAMANTINE, WAXY, etc</b>	

<b>STREAK</b>	
Color of a powdered mineral. Tested by rubbing it against a piece of porcelain ( <b>Streak plate</b> ).	
Most useful for <b>METALLIC MINERALS</b> .	<b>Hematite</b> (gray or red color; red-brown streak)
Most <b>NON METALLIC MINERALS</b>	Have a white streak

<b>DIAPHANEITY</b>	
Way in which a mineral transmits light.	
<b>TRANSPARENT</b>	Transmit light; images can be seen
<b>TRANSLUCENT</b>	Transmit light not images
<b>OPAQUE</b>	Does not transmit light or images

### SPECIAL PROPERTIES

<b>MAGNETISM</b>	Strongly magnetic	<b>Magnetite</b>
<b>ACID OR CHEMICAL REACTION</b>	(CaCO <sub>3</sub> ) reacts with dilute HCl (hydrochloric acid). [(CaMg) CO <sub>3</sub> ]	<b>Calcite Dolomite</b>
	$\text{CaCO}_3 + \text{HCl} \implies \text{CaCl} + \text{H}_2\text{O} + \text{CO}_2$	
<b>TASTE</b>	NaCl; common salt KCl	<b>Halite Sylvite</b>
<b>ODOR</b>	“nasty odor” (stink)	<b>Sulfur Sphalerite</b> (when scratched)
<b>FEEL</b>	Sensation gained by rubbing a specimen	<b>Talc</b> soapy <b>Halite</b> greasy (in humid climates)
<b>FLUORESCENCE</b>	Some minerals when they are exposed to UV light emit a characteristic colored light	Willemite (Zn <sub>2</sub> SiO <sub>4</sub> )
